

WEBSITE HEALTH REPORT

What we found on your site

mizangroupllc.com

Checked 28 September 2026 at 00:07 UTC

93/100

Your site is in good shape.

9 checks passed · 3 could be improved · 0 need action

Worth doing

Could be improved

Content Security Policy

No Content Security Policy is set.

WHY IT MATTERS

A Content Security Policy tells browsers which sources of scripts and other content your website trusts. If an attacker manages to slip malicious code onto a page, the browser refuses to run it.

WHAT TO DO

Ask your web developer to add a Content-Security-Policy header. They can start in report-only mode to see what would break before enforcing it.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Checked page: <https://www.mizangroupllc.com/>

Could be improved

X-Content-Type-Options

The nosniff protection is not switched on.

WHY IT MATTERS

This setting stops browsers from guessing what type a file is. Without it, a file that should be treated as harmless text could, in some cases, be run as code.

WHAT TO DO

Ask your web developer or host to add the header `X-Content-Type-Options: nosniff`.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Checked page: <https://www.mizangroupplc.com/>

Could be improved **DNSSEC**

DNSSEC is not switched on for this domain.

WHY IT MATTERS

DNSSEC adds a digital signature to your domain's DNS records, so visitors cannot be secretly redirected to a fake website or mail server by someone tampering with DNS answers.

WHAT TO DO

Ask your DNS provider to enable DNSSEC signing, then add the DS record they give you at your registrar (many providers, such as Cloudflare, do both in a few clicks).

Everything we checked

AREA	CHECK	RESULT	WHAT WE FOUND
Website security	SSL certificate	Good	Valid for another 79 days, issued by Google Trust Services.
Website security	TLS version	Good	Uses TLS 1.3, the newest and most secure version.
Website security	HSTS (always use HTTPS)	Good	Browsers are told to always use HTTPS for 365 days.
Website security	Content Security Policy	Could be improved	No Content Security Policy is set.
Website security	X-Content-Type-Options	Could be improved	The nosniff protection is not switched on.
Domain & DNS	Domain registration	Good	Registered until 17 September 2028 (720 days from now).
Domain & DNS	Nameservers	Good	2 nameservers are listed.
Domain & DNS	DNSSEC	Could be improved	DNSSEC is not switched on for this domain.
Email security	Mail servers (MX)	Good	1 mail server is listed.

AREA	CHECK	RESULT	WHAT WE FOUND
Email security	SPF (approved senders)	Good	SPF is set up and flags email from unlisted servers as suspicious (~all).
Email security	DKIM (email signatures)	Good	DKIM signing keys are published (selector: google).
Email security	DMARC (anti-spoofing policy)	Good	DMARC sends forged emails to spam (p=quarantine).

What is already working

Good SSL certificate

Valid for another 79 days, issued by Google Trust Services.

The SSL certificate proves to visitors' browsers that they are talking to your real website, and encrypts everything sent between them. If it expires or does not match your domain, browsers show a full-page security warning and most visitors will leave.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Issued by: Google Trust Services
- Expires: 16 December 2026
- Certificate matches the domain name: yes

Good TLS version

Uses TLS 1.3, the newest and most secure version.

TLS is the technology that encrypts the connection to your website. Newer versions (1.2 and 1.3) are secure; older ones (1.0 and 1.1) have known weaknesses and are rejected by modern browsers. This check shows the best version your server offered us.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Negotiated protocol: TLSv1.3

Good HSTS (always use HTTPS)

Browsers are told to always use HTTPS for 365 days.

HSTS tells browsers to always use the secure (HTTPS) version of your website. Without it, a visitor on an untrusted network such as public Wi-Fi can be quietly redirected to an insecure copy of the site.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Header value: max-age=31536000
- Checked page: <https://www.mizangroupplc.com/>

Good Domain registration

Registered until 17 September 2028 (720 days from now).

Your domain name is rented from a registrar and has to be renewed, usually every year. If the renewal is missed, your website and email stop working, and someone else could register the name.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Registrar: Cloudflare, Inc.
- Expires: 17 September 2028

Good Nameservers

2 nameservers are listed.

Nameservers are the directory servers that tell the internet where your website and email live. Having at least two means one can fail without taking everything offline.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Nameserver: michelle.ns.cloudflare.com
- Nameserver: trey.ns.cloudflare.com

Good Mail servers (MX)

1 mail server is listed.

MX records tell other mail systems where to deliver email addressed to your domain. Without them, email sent to you bounces.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Priority 1: smtp.google.com

Good SPF (approved senders)

SPF is set up and flags email from unlisted servers as suspicious (~all).

SPF is a published list of the servers allowed to send email from your domain. Receiving mail systems use it to spot forged emails that pretend to come from you.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- SPF record: v=spf1 include:_spf.google.com ~all

Good

DKIM (email signatures)

DKIM signing keys are published (selector: google).

DKIM adds a tamper-proof digital signature to every email you send. Receivers check the signature against a key published in your DNS to confirm the message really came from you and was not altered.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- Selector checked: google
- Selector checked: fm1
- Selector checked: fm2
- Selector checked: fm3
- Selector checked: selector1
- Selector checked: selector2
- DKIM key found: google._domainkey.mizangroupllc.com

Good

DMARC (anti-spoofing policy)

DMARC sends forged emails to spam (p=quarantine).

DMARC tells other mail systems what to do with emails that claim to be from you but fail the SPF and DKIM checks: deliver, send to spam, or reject. Without an enforcing policy, scammers can send emails that appear to come from your domain.

TECHNICAL DETAILS, FOR WHOEVER MAKES THE CHANGE

- DMARC record: v=DMARC1; p=quarantine; pct=100; rua=mailto:mo@mizangroupllc.com

What happens next

Nothing here is urgent. The three items above are worth passing to whoever looks after your website and DNS.

Want us to handle it? Reply to the email this came with and tell us which items you want done, and we will quote a fixed price in writing before any work starts.

We will run these checks again in 30 days and send you the difference, at no charge.

These results come only from information that is publicly visible to anyone on the internet: DNS records, the domain registry, and a single ordinary visit to the website's home page. Nothing was scanned, probed or logged into. The checks show how things looked at the time above; settings can change at any time.
